

SRI KOGANTI

Senior Cloud / DevOps Engineer

koganti.sharma@gmail.com | +353 86 892 2991 | Cork, Ireland | koganti.ai

SUMMARY

Senior Cloud/DevOps Engineer with 13+ years architecting and operating large-scale AWS infrastructure: Kubernetes, Terraform-driven automation, multi-region high-availability/disaster-recovery design, and SRE practice (SLIs/SLOs, observability, incident response). AWS Certified Solutions Architect with a track record of cutting operational overhead through Python automation. Also extending that same automation instinct into applied AI: built and operate Career Assistant, a production RAG service (LangChain, OpenAI, ChromaDB), and use LLM APIs and agentic tooling daily in platform engineering work — details under Projects.

SKILLS

- AI/LLM Engineering (LangChain, RAG)
- Kubernetes
- CI/CD (Jenkins, GitHub Actions)
- Docker & Ansible
- LLM APIs (OpenAI, GitHub Copilot)
- Terraform
- Monitoring (Datadog, Splunk, Grafana/Prometheus, OTEL)
- Git & Jira
- AWS (Solutions Architect Associate)
- Linux & Bash
- Python

EXPERIENCE

Senior Cloud/DevOps Engineer — Fidelity Investments, Galway, Ireland

02/2023 – Current

- Architected and maintained enterprise-grade Kubernetes infrastructure on AWS for Mend SCA and Mend Renovate; active-active design for Mend SCA delivers zero-downtime regional failover.
- Designed a multi-region Akamai → AWS CloudFront disaster-recovery architecture, achieving 100% success across all DR exercises.
- Supported Fidelity's GitHub Cloud Platform, which powers 60,000+ active repositories, keeping it available, performant, and securely accessible for development teams company-wide.
- Delivered Terraform-based cloud automation for consistent, policy-compliant AWS provisioning across accounts and environments.
- Wrote end-to-end Python automation covering GitHub Apps integrations, event-driven workflows, repository governance, and platform-compliance tooling.
- Built an AI-driven mass onboarding pipeline for SonarQube (parallel repo cloning, language detection, GenAI build/coverage-command generation via the GitHub Copilot API) and a prompt-orchestration layer that infers per-repository build/test commands at scale.
- Built a self-service GitHub repo archival solution (80% less on-call load).
- Designed and maintained a high-throughput webhook delivery platform on GitHub Apps, with an automated test harness and repository-governance automation for large binaries, branch sprawl, and oversized repos.
- Owned the on-call rotation, platform observability, and SRE practice (SLIs/SLOs, error budgets, operational reviews) for GitHub Platform services.
- Led org-wide secure-coding and secrets-management workshops.

DevOps Engineer — TrustAp, Cork, Ireland

12/2021 – 01/2023

- Built AWS infrastructure from the ground up (Terraform) to support development-team deployments; implemented CI with Jenkins.
- Built an end-to-end testing framework with QA that laid the foundation for automation and cut testing time by 50%.
- Designed Ansible-based service orchestration to deploy Dockerized services, with logging and monitoring for the resulting architecture.
- Documented system design for reference and future use; partnered with cross-functional teams on software solutions.
- Evaluated and introduced new technologies into the team's agile development practice.

Senior Software Engineer — Optum (United Health Group), Letterkenny, Ireland

03/2021 – 12/2021

- Designed, built, and automated a security-endorsement process that centralized security telemetry from external tools (Prisma, Rapid7) and internal cloud-native tools (AWS Inspector, AWS GuardDuty).

Software Developer — Trurisk, Dublin, Ireland

11/2020 – 03/2021

- Set up AWS infrastructure with CloudFormation and wrote Python APIs for insurance-focused solutions.
- Built face-matching and document-format-conversion tools, packaged as containerized Lambda functions through CloudFormation.

DevOps Engineer II — Forcepoint, Cork, Ireland

08/2019 – 10/2020

- Owned cloud-services infrastructure, build/delivery pipelines, and monitoring; built semi-automated CI/CD pipelines with Jenkins.
- Automated end-to-end test infrastructure deployment on AWS (Terraform), cutting E2E test duration from 90 to 30 minutes.
- Automated third-party software licence generation for compliance, and tenant onboarding via Docker on AWS ECS.

Software Engineer II — Forcepoint, Cork, Ireland

09/2018 – 08/2019

- Built a cloud-based reporting service and RESTful APIs in Python, with Terraform IaC for AWS resource deployment.
- Automated new-endpoint provisioning on the API Gateway base path, and built a GitHub Pages-hosted Swagger documentation solution for all services.
- Won "Most Innovative Idea" at the company-wide annual Hackathon.

Python Developer — Vearsa, Cork, Ireland

08/2016 – 07/2018

- Built a scalable, secure E-book sales tracking platform in Python, using AWS services including EC2, S3, EBS, RDS, Route 53, CloudWatch, Kinesis, Athena, SNS, SES, and SQS.
- Built an automated report-download engine and web scrapers using Scrapy.
- Built a Pandas-based analytics engine for data analysis.

Software Developer — ODG Technologies, Cork, Ireland

06/2013 – 06/2016

- Built embedded and Python software for public-safety and medical-device products: a radiation-monitoring device, a breath-monitoring device, and a moisture-monitoring device.
- Developed a process-based metal-detection algorithm extending detection range from 50mm to 70mm, plus an automatic error-logging system for assembly-line post-process analysis.

PROJECTS

Career Assistant — Retrieval-Augmented Generation (RAG) Service

Personal project · Ongoing

- Built a RAG service in Python (LangChain, ChromaDB, OpenAI API) enabling natural-language Q&A over resume documents, with PDF/DOCX/TXT ingestion.
- Designed a section-aware ingestion pipeline (custom loader, resume-aware chunker, Presidio-based PII redaction) behind an async FastAPI service for ingestion and retrieval-augmented querying.
- Containerized the stack (FastAPI + ChromaDB) with Docker Compose and built a GitHub Actions CI/CD pipeline (ruff, mypy, pytest, Docker build) enforced on every push.
- Actively extending the retrieve-then-generate pipeline into a tool-calling agent loop (LLM-driven routing between resume search and clarifying-question tools) as hands-on agentic-AI upskilling.

EDUCATION & CERTIFICATIONS

Master of Engineering — Embedded Systems

Munster Technological University, Cork, Ireland · 09/2012

- AWS Certified Solutions Architect – Associate
- Certified Kubernetes Application Developer (CKAD)
